INTERNATIONAL PRELIMINARY EXAMINATION REPORT

International application No.

PCT/US 03/19495

l. Ba	sis	of	the	re	po	rt
-------	-----	----	-----	----	----	----

1. With regard to the **elements** of the international application (Replacement sheets which have been furnished to the receiving Office in response to an invitation under Article 14 are referred to in this report as "originally filed" and are not annexed to this report since they do not contain amendments (Rules 70.16 and 70.17)):

	Des	cription, Pages	
	1-20)	as originally filed
	Clai	ims, Numbers	
	1-12	2	received on 19.07.2004 with letter of 19.07.2004
	Dra	wings, Sheets	
	1/8-	8/8	as originally filed
2.	With lang	n regard to the langu guage in which the int	age, all the elements marked above were available or furnished to this Authority in the emational application was filed, unless otherwise indicated under this item.
	The	se elements were av	ailable or furnished to this Authority in the following language: , which is:
		the language of a tra	nslation furnished for the purposes of the international search (under Rule 23.1(b)).
		the language of publ	ication of the international application (under Rule 48.3(b)).
		the language of a tra Rule 55.2 and/or 55.3	nslation furnished for the purposes of international preliminary examination (under 3).
3.			otide and/or amino acid sequence disclosed in the international application, the examination was carried out on the basis of the sequence listing:
		contained in the inte	rnational application in written form.
		filed together with the	e international application in computer readable form.
		furnished subsequer	ntly to this Authority in written form.
		furnished subsequer	ntly to this Authority in computer readable form.
		The statement that to in the international a	he subsequently furnished written sequence listing does not go beyond the disclosure pplication as filed has been furnished.
		The statement that the listing has been furn	he information recorded in computer readable form is identical to the written sequence ished.
4.	The	amendments have r	esulted in the cancellation of:
		the description,	pages:
		the claims,	Nos.:
		the drawings,	sheets:

INTERNATIONAL PRELIMINARY EXAMINATION REPORT

International application No.

PCT/US 03/19495

5. C]	This report has been established as if (some of) the amendments had not been made, since they have
		been considered to go beyond the disclosure as filed (Rule 70.2(c)).

(Any replacement sheet containing such amendments must be referred to under item 1 and annexed to this report.)

6. Additional observations, if necessary:

V. Reasoned statement under Article 35(2) with regard to novelty, inventive step or industrial applicability; citations and explanations supporting such statement

Claims

No:

1. Statement

Novelty (N)

Yes: Claims 9-12
No: Claims 1-8

Inventive step (IS)

Yes: Claims 9-12
No: Claims 1-8

Industrial applicability (IA)

Yes: Claims 1-12

2. Citations and explanations

see separate sheet

Section V

- 1. Reference is made to the following documents:
 - D1: WO-A-2004/007166
 - D2: PATENT ABSTRACTS OF JAPAN vol. 1997, no. 02, 28 February 1997 (1997-02-28) -& JP 08 273538 A (DAINIPPON PRINTING CO LTD), 18 October 1996 (1996-10-18)
 - D3: DOMININGHAUS HANS: "Die Kunststoffe und ihre Eigenschaften" 1992, VDI VERLAG, DÜSSELDORF
 - D4: "Permeability of Plastics and Elastomers" 1995, PLASTIC DESIGN LIBRARY
- 2. The current application is not clear as required by Article 6 PCT for the following reasons.
- 2.1 Claim 1 searches protection for a flexible mold. It comprises the feature "containing moisture to saturation at a temperature and a relative humidity at the time of use".
 - The amount of moisture as being referred to in claim 1 is therefore depending on the temperature at which the mold is being used. As a result, it can not be seen whenever a mold containing moisture is observed, whether it complies with said unclear feature, because the fact whether said moisture is on a saturated level, will depend on the temperature and the relative humidity of the use of the mold. The use of the mold can not be a feature of the mould per se. The scope of the protection as searched for in claim 1 is therefore not clear.
- 2.2 Claim 6, which searches protection for a mold, refers to method steps. For the skilled man, it is not possible to judge while observing the mold, which viscosity the raw material showed at the moment of making said mold.
- It is noted with reference to paragraph 2 that unclear features cannot be considered to distinguish claimed subject matter and the state of the art. These unclear features are therefore not taken into account for assessing novelty and inventive step.

EXAMINATION REPORT - SEPARATE SHEET

3.1 Document D2, which is considered the closest prior art under Rule 64.1 PCT, discloses a flexible mold comprising a support and a molding layer disposed on said support, a surface thereof being provided with a groove pattern having a predetermined shape and a predetermined size.

Document D2 appears to fail disclosing the feature whereby said support is made of a material having a tensile strength of at least 5 kg/mm².

It should be noted however that the preferred embodiment in D2 for layer 2 appears to be PET, for reasons of tensile strength (cf. D2, paragraph 11), this preferred embodiment being equal to the one of the current application (cf. example 1, page 17, line 20 - page 18, line 26).

Furthermore, the specified tensile strength of at least 5kg/mm² appears to be a common value for PET (cf. D3, 81 N/mm² = 8.3 kg/mm², D4, 179 Mpa = 18.3 kg/mm²)

The specified tensile strength range appears to be nothing more that a standard value. D2, since it discloses the use of the same material as the preferred embodiment of the current application, is therefore considered to disclose all the features of claim 1.

The subject matter of claim 1 is therefore not new in the sense of Article 33(2) PCT.

- 3.2 Document D2, which is considered the closest prior art under Rule 64.1 PCT, discloses a method of manufacturing a microstructure having a projection pattern having a predetermined shape and a predetermined size on a surface of a substrate, comprising the steps of :
- preparing a flexible mold comprising a support, and a molding layer disposed on said support and having a groove pattern having a shape and a size corresponding to those of said projection pattern on a surface thereof;
- arranging a curable molding material between said substrate and a molding layer of said mold and filling said molding material into said groove pattern of said mold;
- curing said molding material and forming a microstructure having said substrate and said projection pattern integrally bonded to said substrate; and
- releasing said microstructure from said mold.

The subject matter of claim 9 differs therefrom in that the support is made of a material having a tensile strength of at least 5 kg/mm2 and containing moisture to

saturation at a temperature and a relative humidity at the time of use.

The subject matter of claim 9 is therefore new in the sense of Article 33(2) PCT

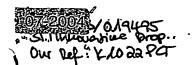

The feature that the support is made of a material having a tensile strength of at least 5 kg/mm2 appears to be implicitly disclosed by the preferred embodiment of D2 (cf. also paragraph 3.1 and the documents D2, D3 and D4).

The feature "containing moisture to saturation at a temperature and a relative humidity at the time of use" is neither known nor suggested by any of the available prior art under Rule 64.1 PCT. The solution according to claim 9 is therefore considered to be inventive if only the available prior art under Rule 64.1 PCT is taken into account.

- 4. The following is noted too:
- Document D1 is not considered to be comprised in the prior art under Rule 64.1 (a) (a)(b) PCT. It is noted however that upon entering the European phase, D1 will be considered prior art under Article 54(3) EPC.

It appears that document D1 is very relevant prior art (cf. page 8, lines 6 - 10). Since D1 appears to claim a valid priority, the claimed priority of the current application appears to be not correct. Furthermore, D1 upon entering the regional phase, would be novelty destroying for at least the subject matter of claims 1 and 9.

- The features of the claims are not by followed by the reference signs relating to (b) said features (Rule 6.2(b) PCT).
- (c) Rule 5.1(a) (ii) PCT is not fulfilled since the documents D1 and D2 are not acknowledged in the description.

New Claims

ni dodini.

VOSSIUS & PARTNER PATENTANWÄLTE SIEBERTSTR. 4 81675 MÜNCHEN

What is claimed is

1. A flexible mold comprising:

a support made of a material having a tensile strength of at least 5 kg/mm² and containing moisture to saturation at a temperature and a relative humidity at the time of use by a moisture absorption treatment applied in advance; and

a molding layer disposed on said support, a surface thereof being provided with a groove pattern having a predetermined shape and a predetermined size.

- 2. A flexible mold as defined in claim 1, wherein said support and said molding layer are transparent.
- 31 A flexible mold as defined in claim 1 or 2, wherein said support is a film of a
- at least one kind of plastic material selected from the group consisting of polyethylene terephthalate, polyethylene naphthalate, stretched polypropylene, polycarbonate and triacetate.
- 5. . . A flexible mold as defined in any one of claims 1 to 4, wherein said support has a thickness of 0.05 to 0.5 mm.
 - 6. A flexible mold as defined in any one of claims 1 to 5, wherein said molding layer comprises a base layer made of a first curable material having a viscosity of 3,000 to 100,000 cps at 10 to 80°C and a coating layer made of a second curable material having a viscosity of not higher than 200 cps at 10 to 80°C, the coating layer being applied over a surface of said molding layer.
- 7. A flexible mold as defined in claim 6, wherein said first curable material and said second curable material are photo-curable materials.

5

25

- 8. A flexible mold as defined in any one of claims 1 to 7, wherein the groove pattern of said molding layer is a lattice pattern constituted by a plurality of groove portions arranged substantially in parallel while crossing one another with predetermined gaps among them.
- 9. A method of manufacturing a microstructure having a projection pattern having a predetermined shape and a predetermined size on a surface of a substrate, comprising the steps of:

tensile strength of at least 5 kg/mm² and containing moisture to saturation at a temperature and a relative humidity at the time of use by a humidity absorption treatment applied in advance; and a molding layer disposed on said support and having a groove pattern having a shape and a size corresponding to those of said projection pattern on a surface thereof; a stranging a curable molding material between said substrate and a molding layer of said mold and filling said molding material into said groove pattern of said mold; curing said molding material and forming a microstructure having said substrate and said projection pattern integrally bonded to said substrate; and releasing said microstructure from said mold.

- 20 10. A manufacturing method as defined in claim 9, wherein said molding material is a photo-curable material.
 - 11. A manufacturing method as defined in claim 9 or 10, wherein said microstructure is a back plate for a plasma display panel.
 - 12. A manufacturing method as defined in claim 11, which further comprises a step of independently arranging a set of address electrodes substantially in parallel with each other while keeping a predetermined gap between them on a surface of said substrate.
